ADM precursor [Contains: Adrenomedullin (AM); Proadrenomedullin N-20
terminal peptide (ProAM-N20) (ProAM N-terminal 20 peptide) (PAMP)].
Name=ADM, Synonyms=AM;
Sus scrofa (Pig)
                                                                                                              MOD_RES

10-SEP-1999;
15-OCT-1999;
                 The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidy) and maleimide groups attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      terminus, PO71 represents preproAM as 122-131 with the sequence Tyr-Gly-Gly attached at the N-terminus, PO72 represents preproAM as 116-146 and PAMP-20 represents the proAM N-terminus. The Ab are useful for the prevention and/or treatment of cancers, e.g. adrenal, nervous system, lung, colon, ovarian and breast cancer by inhibiting cell growth. They are also useful for regulating insulin secretion and blood glucose metabolism and therefore for treating and/or preventing diabetes type II. They may be used for the diagnosis or treatment of conditions relating to pregnancy e.g. preeclampsia. The Ab are also useful for the following:

(i) regulating neurotransmission or neuron growth in areas of the central nervous system, (ii) lessening or inhibiting mast cell degranulation and hence reducing the effects of an allergic response; (iii) inhibiting or preventing bacterial and fungal growth (to treat infection); (1v) facilitating wound healing; and (v) promoting organ and bone development
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protection; endogenous therapeutic peptide; peptidase; conjugation; blood component; modification; succinimidyl; maleimido group; amino; hydroxyl; thiol; hormone; growth factor; neurotransmitter.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                    The invention relates to antagonists of the vasoactive peptide calcitonin gene related peptide (CGRP) and other members of the CGRP superfamily. The invention also relates to amino the terminal modifications of peptides to improve their ability to bind to a member of the CGRP receptor super-family. CGRP antagonists are used for inhibiting CGRP activity which can be used in vitro e.g. in assays to identify and/or isolate CGRP receptors or with intact cells either in vitro or in vivo to inhibit the effect of CGRP binding to its receptor. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes. AAB90829 to AAB92441 represent peptides which can be used in the exemplification of the present invention

Peptides may be created by deletion of some amino acids from the N-terminal of S1. The peptides are applicable in drug compositions for treating cancer e.g. stomach cancer, colon cancer, pulmonary cancer, ovarian cancer, liver cancer or pancreatic cancer. The current sequence represents an angiogenesis inhibiting peptide of the

                                                                                                                                                                                                                                             0
```

This invention relates to a novel method of modulating neurogenesis in the neural tissue of a patient exhibiting symptom(s) of a central nervous system disorder, such as neurodegenerative, ischaemic or learning and memory disorder or neurological trauma. The method involves at least one agent (A) that elevates intracellular cyclic adenosine monophosphate (cAMP) levels or at least one agent (B) that elevates intracellular Ca 2+ levels in the neural tissue, which is administered where (A) modulates and (B) induces neurogenesis. The invention may be useful for the production of compounds with a nootropic, neuroprotective, CNS-Gen, cerebroprotective, vasotropic, anticonvulsant, antiparkinsonian. haemostatic, hypertensive, muscular-Gen, opthalmological, antiinflammatory, analgesic or antidiabetic activity. These compounds may act as neurogenesis modulators, neural stem or progenitor cell proliferation, differentiation and/or migration modulators, neural tissue

Use of agent(s) that elevate intracellular cyclic adenosine monophosphate or intracellular calcium levels in neural tissue for modulating

neurogenesis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   intracellular neural cAMP enhancers, intracellular neural cAMP stimulators or intracellular neural ca 2+ enhancers. The invention is useful for modulating neurogenesis in neural tissue of a patient exhibiting at least one symptom of central nervous system disorder, such as Parkinson's disease and Parkinson's disorders. Huntington's disease, Alzheimer's disease, muticple sclerosis, amyotrophic lateral sclerosis, Shy-Drager syndrome, progressive supranuclear palsy, Lewy body disease,
Bridon DP,
                                                                                                                                                                                                                                                                            Protection; endogenous therapeutic peptide; peptidase; conjugation; blood component; modification; succinimidyl; maleimido group; amino hydroxyl; thiol; hormone; growth factor; neurotransmitter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                G-protein coupled receptor activators, neurogenesis inducers, intracellular neural cAMP enhancers, intracellular neural cAMP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity ivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes. AAB90829 to AAB92441 represent peptides which can be used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a modified therapeutic peptide (I) comprising a therapeutically accident amino acid region (III) and a reactive group (III) (e.g. succinimidy) and maleimido groups) attached a less therapeutically active amino acid region (IV), which covalently
                                                                                                      WPI; 2001-282044/29
N-PSDB; AAH19806.
                                                                                                                                                                                                                                                                                                                                                                                                                                      31-JUL-2001 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAB75110 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 52 AA;
                                                                         Producing adrenomedullin useful
                                                                                                                                                                                                                                                                                                                                 Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                           Adrenomedullin; glycine extended adrenomedullin; AM; AM-gly; adrenomedullin precursor; fusion protein; pharmaceutical; diagnostic.
                                                                                                                                                                                                                                                                                                                                                                                                          Human adrenomedullin (AM) protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 adrenomedullin precursor. The method comprises: (a) producing the fused protein using a recombinant host cell; (b) restricted digestion of the fused protein by a protease followed by collection of sediment; and (c) dissolving the sediment and extracting adrenomedullin precursor. The method can be used for the production of adrenomedullin precursor for pharmaceutical and diagnostic applications. AAH19806 to AAH19866 and AAB75110 to AAB75124 represent sequences which are used in the exemplification of the present invention
                                                                                                                      The invention relates to antagonists of the vasoactive peptide calcitonin gene related peptide (CGRP) and other members of the CGRP superfamily. The invention also relates to amino the terminal modifications of peptides to improve their ability to bind to a member of the CGRP receptor super-family. CGRP antagonists are used for inhibiting CGRP activity which can be used in vitro e.g. in assays to identify and/or isolate CGRP receptors or with intact cells either in vitro or inhibit the effect of CGRP binding to its receptor. The present sequence is human adrenomedullin peptide
                                                                                                 Sequence
                                                                                                                                                                                                                                                                  Claim 5; Col 25-26; 24pp; English.
                                                                                                                                                                                                                                                                                             Vasoactive peptides useful for inhibiting calcitonin gene related receptor activity.
                                                                                                                                                                                                                                                                                                                                       WPI; 2001-564216/63

                                                                                                                                                                                  and related peptides, such as adrenomedullin, that have at least 70% identity to the native form but are modified such that the tendency of the peptide to aggregate is reduced. Preferred regions for modification include those for which the peptide is polymorphic amongst different species, which increase the propensity of the peptide to form local interactions of the alpha-helical type, or which reduce the number of hydrophobic residues or increase the net charge of the peptide. When aggregation is reduced or prevented, lower doses of the drug can be used. Side-effects and undesired responses are minimised by retaining high sequence identity to the human peptide
                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                            hypotensive

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to peptides comprising an amino acid sequence derived from a fully defined 52 amino acid sequence (S1) given in the specification. Peptides may be created by deletion of some amino acids from the N-terminal of S1. The peptides are applicable in drug compositions for treating cancer e.g. stomach cancer, colon cancer, pulmonary cancer, ovarian cancer, liver cancer or pancreatic cancer. The current sequence represents an angiogenesis inhibiting peptide of the
                                                                                                                                                                                                                                               WO2003078658-A2
                                                                                                                                                                                                                                                                                                                                                   neuroleptic; antisense therapy; gene therapy; adrenomedullin agonist; schizophrenia; gene expression; decidual protein induced by progesterone; DEPP; adrenomedullin; cold shock domain protein A; csdA; antisense; siRNA; ribozyme; triple helix formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human mature adrenomedullin protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                11-MAR-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 52 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptides with effect on inhibiting angiogenesis in cancer cells and inhibiting proliferation of cancer cells, and encoded polynucleotide applicable in drug compositions for treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Homo sapiens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             population comprises determining the magnitude of expression, in members of the population, of at least one gene selected from the gene encoding decidual protein induced by progesterone (DEPP), the gene encoding adrenomedullin and the gene encoding cold shock domain protein A (csdA) in a sample, and comparing the magnitude of expression to a baseline of expression of the gene, where increased molecule expression indicates the presence of schizophrenia. An antisense molecule, sikNA, ribozyme or nucleic acid molecule promoting triple helix formation that specifically inhibit the expression of DEPP, csdA or adrenomedullin genes, is useful for the manufacture of a medicament for the treatment of schizophrenia. An antibody that specifically binds an epitope of DEPP, csdA or adrenomedullin is also useful for the manufacture of a medicament for the medicament for the manufacture of a medicament for the medicament for the medicament for the medicament for the manufacture of a medicament for the medicament for the medicament for the manufacture of a medicament for the medicament for the medicament for the manufacture of a medicament for the medicament for the medicament for the manufacture for a medicament for the medicament for the medicament

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  a cell comprising a first nucleic acid encoding a leader peptide and a second nucleic acid fragment encoding the desired (poly) peptide. The first and second fragments are within the same open reading frame of the first nucleic acid and the leader peptide is functionally equivalent to an N-terminal leader peptide found with the pre-peptide of a lantibiotic. The host cells and nucleic acids are useful for producing, harvesting and post-translational modification of polypeptides. The polypeptides may be used in the production of pharmaceuticals, e.g. as antigen for vaccine or immunogenic composition. This sequence represents a polypeptide relating to the novel method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Harvesting a desired polypeptide produced by a recombinant host cell, producing pharmaceuticals, comprises selecting a recombinant nucleic comprising nucleic acid fragments encoding a leader peptide and the polypeptide.
                                                                                                                                                                                                                                                                                                                   calcitonin receptor stimulating peptide; CRSP; cAMP activity, skeletal disorder; cancer; hypertension; restenosis; analgest appetite suppressant; diuretic; vasotropic; cytostatic; diure osteopathic; anorectic; hypotensive; human; AM.

dependent sodium ion uptake and furthermore act to inhibit calcium ion uptake by the cell. The present invention describes mutant peptides derived from the CRSPs that have additions, deletions and/or substitutions of one or more amino acids, yet that retain similar activity and are useful for developing drug compositions and pharmaceutically acceptable carriers to treat and/or prevent skeletal disorders, cancer, hypertension and restenosis. Furthermore, CRSPs can also be used as analgesics, appetite suppressants and diuretics such that exhibit vasotropic, cytostatic, diuretic, osteopathic, anorectic and hypotensive activities. This peptide sequence is a human AM peptide that has cAMP activity, given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Calcitonin receptor stimulating peptides promoting cAMP production in cells for treatment of cancer, skeletal disorders and hypertension and appetite suppressants and analgesics.
                                                                                                                                                                                                                                                                                                                                                                 This invention relates to novel calcitonin receptor stimulating peptides (CRSPs) that are expressed in the central nervous system and act on the calcitonin receptor to promote the production of cAMP within a cell. Specifically, it refers to CRSPs that can stimulate concentration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; Fig

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC The invention relates to a collection of capture compounds capable of CC binding to binmolecules to form complexes that are stable under mass CC spectrometry conditions. The formulae for the capture compounds comprises CC sets of compounds of formula (I)-(III) given in the specification. Also CC comprising a biomolecule with the above collection and identifying or CC detecting bound biomolecules), separating protein conformers (by CC contacting a composition comprising a biomolecule with the above collection and identifying or CC collection, separating the members of the collection and identifying CC bound proteins), reducing diversity of a complex mixture of biomolecules (by contacting the mixture with the above collection and separating each CC set of complexes of capture compounds with biomolecules (by sorting cells if complexes of capture compounds with biomolecules (by sorting cells crom a single subject into sets according to a phenotype, contacting CC mixtures of biomolecules from each set with the above collection and comparing the patterns of biomolecules binding from each set). The CC comparing the patterns of biomolecule binding from each set). The CC comparing the patterns of biomolecule (by sorting cells of biomolecules, especially proteins (e.g. analysis of a proteome), using mass spectrometry, especially matrix assisted laser desorption ionisation compound of the invention.

CC compound of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                           shock, or in a pharmaceutical composition for inducing vasoconstriction. Specifically, AM(11-22) is a short peptide derived from human adrenomedullin (AM), which is a vasoregulatory compound that influences blood pressure. The present invention describes screening assays to identify compounds including antibodies, small molecule inhibitors or peptides that modulate AM(11-22)-mediated vasoconstriction and as such represent novel vasodilators or vasoconstrictors. Accordingly, AM(11-22) can be used therapeutically in a pharmaceutical composition to inhibit blood flow following traumatic or surgical injury, as well as for vasodilatory, septic or haemorrhagic shock, and thus exhibits vasotropic, hypotensive, immunosuppressive and antibacterial activities. This polypeptide sequence is the mature human adrenomedullin protein of the
                                                                                                                                                                   Sequence 52 AA;
                                                                                                                                                                                                             invention.

Numerous actions have been reported most related to the physiologic control of fluid and electrolyte homeostasis. In the kidney, am is diurette and natriurette, and both am and pamp inhibit aldosterone secretion by direct adrenal actions. In pituitary gland, both peptides at physiologically relevant doses inhibit basal ACTH secretion. Both peptides appear to act in brai and pituitary gland to facilitate the loss of plasma volume, actions which complement their hypotensive effects in blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SUBCELLULAR LOCATION: Secreted.
TISSUE SPECIFICITY: Highest levels found in pheochromocytoma and adrenal medulla. Also found in lung, ventricle and kidney tissues.
SIMILARITY: Belongs to the adrenomedullin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     adrenal gland.";
